

Award-Winning Scientifically Engineered Adhesive System

Best New Product
SEFF 2007

Been there, Done That! Mercury says "never again!"

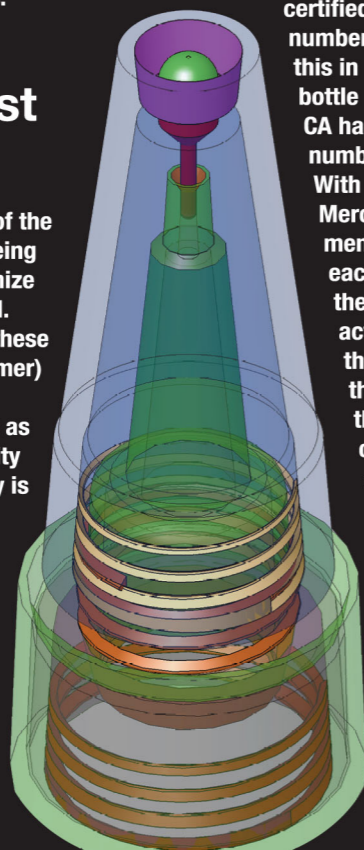

With Mercury the bottle cap frustration is gone forever! The bottle top Mercury has designed actually screws on and off instead of the usual push on and pull off. The Mercury application channel is also scientifically engineered in such a way as to help prevent clogging. This remarkable cap is actually two caps in one to preserve freshness and is designed with a pin built right into the tip of the cap as well as a unique pressure sealing mechanism to maintain freshness.

Imitation is the purest form of flattery.

The Mercury Bottle top (designed by one of the Mercury Founders) is a first and is now being copied by other CA companies who recognize that their designs have indeed been flawed. Mercury accepts the flattery and smiles at these companies imitations but we (and the consumer) knows that even though the bottle top can be copied NO ONE can match the Mercury Science as what is inside the bottle is USA produced quality and not overseas industrial remnants. Mercury is quality and that is what it is all about.

Mercury Adhesive's exclusive "Pin in Cap" bottle top screws on and off instead of the usual push-pull. This assures a smooth never clog operation and a tight seal preserving freshness.

The Only CA
Manufactured
in the USA!

Every bottle is serialized and tracked.

Being ISO 9001:2000 certified, quality is number one and with this in mind every bottle of Mercury CA has a serial number on the bottle. With this number Mercury management can track each batch from the person who actually processed the chemistry all the way to the person who put the bottle in the box for shipping. Further to this quality circle, Mercury maintains samples of each batch for over 2 years for consistency and quality testing. Quality products do not need finite warranties or expiration dates. As a professional company, Mercury will stand behind their products no matter what the date is or when the product was purchased. With this in mind the Mercury warranty is simple...Unconditional, and when we say unconditional we mean it! No time frames, no hoop jumping, just quality product.

What's in a name?

Each bottle of Mercury CA has the scientific viscosity right in the name and is especially formulated to give you superior results. The smaller the number the thinner the product. Be sure and read more about the extensive science behind each of the Mercury products on our website.

M5T is the thinnest in the Mercury line with a viscosity of 5. M300M a medium viscosity and M1100G gap filling or thick viscosity. Each formula is designed to bond a wide variety of materials including wood, paper, cardboard, leather, fabrics, etc.

M100F and M1000F are our Foam Compatible, low odor products. These products provide a "low bloom" cure on plastics and other materials and are simply the best products on the market for foam applications.

M3500FL is a very thick flexible adhesive that will display excellent peel and impact strength and is well suited to applications involving vibration, thermal shock, temperature cycling and high humidity.

Our M100XF is the result of nearly 2 years of lab work by Mercury Chemist. It is formulated with Mercury proprietary ingredients resulting in a product that is among the fastest, strongest and highest quality ever available in a CA. M100XF excels on Light Ply, Carbon and other composite materials and many are calling it "The ARF Glue" as it is used to go over all of the joints on new aircraft before the first flight.

M100XF was recently selected as the best new product at SEFF 2007 as voted on by over 280 pilots.

Mercury MH16 is a General Activator/Accelerator that uses Heptane (MH16) as a base. This chemical base deposits the correct balance of neutralizing ions on the surface. MH16 works great on foam and is not as aggressive as other products so as to give you a better bond.

M68DB debonder is specially formulated. It is a clear liquid with a relatively low evaporation rate that attacks and dissolves cured or uncured CA.

Mercury users tell it like it is!

Just had to drop you an e-mail and say how much I like your product. I have been building models for 25 years - mostly jets - and I have tried all the adhesives out there. Some good some not so good. I came across your display in my local hobby shop and after going back and forth between your selection and my usual xyZ glue. I decided to take a chance and got some of the Thick version Mercury.

Well, after a whole bottle, I am walking out the door to buy MORE. What a wonderful product! And did I mention "WHOLE" bottle. This is the first time I have gotten to use the entire quantity of adhesive. "Good to the last drop!" And even more incredible... I NEVER HAD TO STOP AND UNCLOG THE NOZZLE! BRILLIANT!!!!

Thanks again for a great product.

Regards,

We recently received one of the dealer packs of Mercury CA. I didn't have the opportunity to try any of the glues at SEFF, so I wanted to test them personally before committing to them on them on the website. I recently finished two prototype projects using Mercury exclusively, and I just wanted to let you know that I'm totally satisfied. These are the best CA's I've ever used. I especially like the cap design. We'll begin adding them to our website soon, and we look forward to lots of business w/ Mercury.

Thanks,
Ben Fisher, 3DHobbyShop.com

I am now 80, fly my own airplanes, write for magazines and enjoy the hobby and all it has to offer! It has been a lifetime of passion for me. In all of my years of building I have never been as excited about a glue as I am about the Mercury line of Scientifically Engineered Adhesives.
